Gravie Hiring Team

Staff AI Test Automation Engineer — AI-Driven Playwright Automation

Via: Gravie careers portal

Re: Staff AI Test Automation Engineer — Automation Systems, Agentic AI, SDET Depth

Dear Gravie Hiring Team,

I'm applying for the Staff AI Test Automation Engineer role. You need someone who picks up an in-flight Playwright migration, drives it to completion, and builds the systems — frameworks, feedback loops, CI gates, instrumentation — that let AI agents generate, execute, and maintain tests at scale. That is how I work: I build automation systems, not individual test cases, and I bring 25+ years of SDET and Test Automation Lead practice plus hands-on agentic infrastructure to prove it.

At Knowledgecity (Dec 2020–Aug 2025) I hired and trained the test automation team and shipped end-to-end regression suites with health dashboards and alert systems over complex deployments. I ran the CI/CD quality pipeline (Apache, REST, SQL, AWS, React) with Cypress, Selenium, Postman, and JUnit under Git merge workflows — pipeline stages, per-change quality gates, and fast-feedback optimization that transfer directly to GitLab. I practiced your API-vs-UI judgment daily, verifying integrations at service boundaries (custom REST APIs, webhooks, SFTP, SAML, OAuth) across SAP, Oracle, Workday, Coursera, UKG, and Zoom, and reserving end-to-end UI tests for real user journeys. I also shipped a RAG support chatbot with guardrails under SOC 2 controls, iterating prompts, context structures, and validation patterns — the same loop that raises AI first-pass test-generation rates.

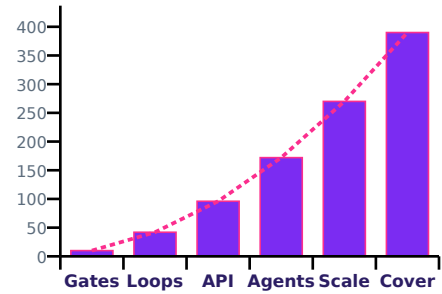

My agentic depth is current and hands-on. On ZeroClaw's 32.8k-star Rust gateway I ship the infrastructure AI agents run on: a merged context-window meter unifying 9 LLM providers for model routing and cost attribution (PR #7946), live serving-provider identity on usage events across fallback and model switches (PR #8966, open), and an agent lifecycle observer (idle/working/blocked/released) over JSON-RPC (PR #8337, requirements adopted into the vendor-neutral design). I work daily in build-validate-fix-resubmit loops with AI coding agents through structured context and reviewer-driven validation — the exact workflow your Playwright generation loops need.

Two honest gaps and my ramp plan. Playwright itself is not in my employment history — my modern end-to-end base is Cypress, Selenium, JUnit, and Postman — so I ramp through transferable page-object, fixture, and convention discipline, starting with your existing framework's patterns. Likewise my CI history is Git/Bitbucket rather than GitLab, and I hold no Geb/Spock, Pact, or claims-system background, so I make no claim there; I bring migration discipline from production software conversions plus API-boundary testing judgment instead. What I offer from day one is the builder mindset: systems, feedback loops, and automation leverage that increase regression coverage and keep defects out of production.

How I fit this role:

- **Automation systems, not test cases.** Regression suites with dashboards and alerting; CI quality gates per change; instrumentation aimed at highest-value gaps.
- **Agentic AI, hands-on.** Daily AI-agent build loops; RAG + guardrails shipped; provider routing, cost attribution, and lifecycle observability in a 32.8k-star gateway.
- **API vs. UI judgment.** REST, webhooks, and service-boundary verification across six enterprise integrations; end-to-end UI reserved for user journeys.
- **Honest ramp, fast start.** Cypress/Selenium page-object discipline into Playwright; Git CI into GitLab; migration and review rigor from day one.

Value: Coverage Up, Defects Down

Gravie's mission — benefits people can actually use — deserves delivery machinery that moves fast without shipping defects. I'd welcome the chance to drive your Playwright migration to completion and scale the AI loops around it — happy to walk through any ZeroClaw PR or Knowledgecity pipeline decision in an interview.

Best regards,

Eugene L. Buchanan
