KoBold Metals Hiring Team
Software Engineer — Data Systems Engineering

Re: Software Engineer, Data Systems — Python pipelines, geospatial AI

Dear KoBold Hiring Team,

I did not ever think I would be applying to be a KoBold. However here I find myself bringing a wide skill set to your table with the gleam of treasure in my eyes.

You are driving the edge of geologic data exploration with AI making discoveries with less guessing and more knowing.

That is a craft I can be excited about as a lifelong gem and mineral prospector and information systems enthusiast.

I am looking for a long term role that I can grow with. I have sharpened my skills lately with Rust and self-improving agentic harnesses with RAG, MCP, knowledge graphing.

How I fit this role:

● **Agent Agentic AI infrastructure.**

Lifecycle observer, model routing + cost attribution in a 32.8k-star Rust gateway.

● **React Frontends, Rust gateway, Django builds.**

React frontends; Rust gateway contributions; Django/WordPress builds.

Here is a sample of my work for an AI sampling project I am working on using Python that scouts turquoise prospects in Baja California.

encuentralo.mx/baja-mineral

Please take time to review my resume and consider me for the role as a software engineer. My worldly off-grid renewable experience is for hire as well, and is useful in remote field operations.

I am ready to work. I can act as a corporate Swiss Army knife with LoRa GPS.

● **RAG Retrieval and evaluation.**

RAG + guardrails shipped under SOC 2; regression suites with dashboards.

● **Au Prospector who embeds.**

Lifelong prospector; field-ready; learns geology fast, supports users.

Sincerely, Eugene L. Buchanan
