Nexaminds Hiring Team
Senior Backend QA Engineer — AI System Validation (Canada)

Re: Senior Backend QA — API Automation, AI Agent Validation

Dear Nexaminds Hiring Team,

I am applying for your Senior Backend QA Engineer role. You validate AI systems where exact-match assertions fail — and that is exactly where I do my best work.

At Knowledgecity (Dec 2020-Aug 2025) I hired and trained the automation team and ran the CI/CD quality pipeline with Cypress, Selenium, Postman, and JUnit.

I test at service boundaries: REST APIs, webhooks, SFTP, SAML and OAuth across SAP, Oracle, Workday — with concise test plans from dense requirements.

I shift left: local-env setup, white-box code reading for dependencies and upstream impacts, dashboards and alerting over complex deployments.

How I fit this role:

● API Backend API automation.

Postman manual + automated REST; OpenAPI suites; service-boundary judgment.

● Rust White-box + shift-left.

Code reading, dependency mapping, local-env testing, dashboards.

On ZeroClaw's 32.8k-star Rust gateway I ship agent infrastructure: context-window routing, cost attribution, lifecycle observability — scoring behavior, not just output.

github.com/eugeneb50

My API automation base — Postman plus Cypress/Selenium/JUnit over REST/SQL pipelines — maps directly onto Karate conventions, and my daily agent-infrastructure work ramps fast into ADK and MCP validation.

I am ready to work. I communicate directly, plan precisely, and build frameworks where deterministic tools stop.

● Eval AI validation.

RAG + guardrails under SOC 2; routing, cost, lifecycle scoring in gateway.

● QA Karate + ADK ramp.

Cypress/Selenium discipline into Karate; agent loops into ADK/MCP.

Sincerely, Eugene L. Buchanan
